

PROJECT PROPOSAL & BUSINESS CASE

WarisanKita

AI & Blockchain-Powered Islamic Estate Planning Platform

Smart Wasiyyah Drafting · Automated Faraid Distribution · Tamper-Evident Vault

Empowering every Muslim in Malaysia to draft a Shariah-compliant *wasiyyah* in under 30 minutes, automatically compute Qur'anic *Faraid* shares with exact precision, and secure every will on a tamper-proof ledger — directly confronting the **RM 70+ billion** of frozen Muslim estates in the nation.

01 Executive Summary

WarisanKita is a mobile-first platform that turns Islamic estate planning — today a costly, intimidating, and widely neglected process — into a guided, 30-minute task that any Muslim adult can complete from a phone.

Across Malaysia, an estimated **RM 70+ billion** of Muslim wealth sits frozen in *Amanah Raya* and the *Mahkamah Syariah* because the deceased left no clear, valid *wasiyyah*. The consequences are not abstract: widows lose access to the family home, orphans cannot withdraw a late father's EPF, property is abandoned, and families fracture over disputes the Qur'an's inheritance laws were revealed to *prevent*. This is a failure of one of the five *Ḍarūriyāt* — *Ḥifẓ al-Māl*, the protection of wealth.

WarisanKita addresses this with three tightly integrated capabilities:

Guided Drafting

A fiqh-grounded conversational assistant walks users through a valid wasiyyah step by step in plain language — enforcing rules such as the 1/3 bequest cap with cited evidence.

Exact Faraid

A rule-based engine computes each heir's Qur'anic share using **exact rational arithmetic** — no rounding error — handling 'aul, radd, kalalah, and mahjūb with verse-level citations.

Immutable Vault

Every will and amendment is written to a SHA-256 hash-chained ledger that makes forgery, loss, and post-death tampering instantly detectable.

This is not just a concept — a working prototype already exists

Unlike a typical paper proposal, this submission is backed by a **complete, runnable full-stack prototype** (React + TypeScript web client, Node/Express API). The core Islamic logic is **real and verified**: the Faraid engine passes **15 automated tests** against classic textbook cases, and the blockchain vault demonstrates live tamper detection. Government and infrastructure integrations are transparently simulated — see the honesty matrix in §9.

7

Core features, all implemented

“Whoever leaves wealth, it is for his heirs.”

— Ṣaḥīḥ al-Bukhārī 2298. WarisanKita exists to make sure that wealth actually reaches them.

This document is a pitch-style proposal intended for university assessment and for engaging potential institutional partners (JAKIM, Amanah Raya, Islamic banks & takaful operators). All Shariah computations should be validated by a certified *faraidh* practitioner before real-world use.

How to read this document

Sections 3–5 make the **case and the product**; sections 6–9 provide the **technical and evidentiary depth** a serious reviewer expects; sections 10–15 cover the **commercial, spiritual, and delivery** dimensions. Every claim about what is built today is verifiable in the public repository.

Verify the prototype yourself. Clone and run in two commands:

```
git clone https://github.com/TommiKiramawarisanKita && cd warisanKita && npm install  
&& npm run dev
```

Then open <http://localhost:5173> — the app seeds a demo estate so every screen is populated.

03 The Problem — A Silent National Crisis

Most Muslims in Malaysia will pass away without a valid wasiyyah. The result is a slow-motion catastrophe of frozen wealth, financial hardship, and family conflict.

**RM
70B+**

Estimated Muslim estates frozen in
probate

Years

Typical time an estate stays locked
— sometimes decades

High

Cost & legal intimidation of
traditional drafting

Why does the wealth freeze?

Root cause	What happens in practice	Who is hurt
No wasiyyah written	The estate enters a lengthy faraid + probate process with no clear instructions; assets are locked pending resolution.	Widows, orphans, dependants
Faraid miscalculated	Manual share computation is error-prone; 'aul/radd/mahjüb edge cases are misunderstood, triggering disputes.	All heirs; the family's unity
Documents lost or contested	Paper wills are misplaced, forged, or challenged; there is no tamper-proof record of intent.	Rightful beneficiaries
Low literacy & awareness	Many adults — especially the young, single, and mualaf — never realise estate planning applies to them.	The whole Ummah

The human cost

The widow

Cannot access the family home or joint accounts; faces years of uncertainty while grieving.

The orphan

Cannot withdraw a late father's EPF or insurance to fund education and daily needs.

The family

Siblings fall into *fitnah* over shares — the precise outcome Qur'anic law was revealed to prevent.

*This is not merely an administrative inconvenience. Failing to execute the Qur'anic inheritance commands (An-Nisā' 11–12, 176) is a breach of Ḥifẓ al-Māl — one of the five necessities (Ḍarūriyāt) of the Sharī'ah. It is therefore an **essential need, not a luxury**.*

Why now?

Three enablers have converged: (1) near-universal smartphone penetration among Malaysian Muslims; (2) mature, explainable rule-based computation for Faraid; and (3) practical tamper-evident ledgers. The technology to solve this finally exists — what has been missing is a product that unifies **guidance, computation, and trust** in one place. That product is WarisanKita.

04 The Solution — What WarisanKita Does

One app that guides a Muslim from "I have no will" to a complete, Shariah-compliant, tamper-proof estate plan — and teaches them why every decision is correct.

Figure 4.1 — The core user journey: Home Dashboard → AI Wasiyyah Drafter → automated Faraid distribution. (Recreated from the live prototype.)

The value in one sentence

WarisanKita compresses a process that today costs hundreds of ringgit, requires legal literacy, and is routinely postponed until it is too late — into a **guided, accurate, trustworthy, 30-minute experience on a phone**, while teaching the user the Islamic *why* behind every step.

05 Product Walkthrough — Seven Core Features

All seven proposed features are implemented in the working prototype. Each carries its fiqh justification so the user is never asked to simply "trust the app".

1

AI Wasiyyah Drafter • BUILT

A deterministic, fiqh-grounded conversational flow guides the user through a complete wasiyyah in seven steps — identity, assets, heirs, bequests, hibah/waqf, witnesses, and signing. It explains rulings (e.g. the 1/3 bequest cap; bequests cannot go to legal heirs) inline, with citations, in plain language.

Grounded in a local fiqh corpus — every guidance line is traceable to a source, never invented.

2

Faraid Calculation Engine • BUILT & TESTED

The heart of the platform. Computes each heir's share from Qur'an An-Nisā' 11–12 & 176 using **exact fractions** — fixed shares (furūd), residuary (‘aṣabah, "to the male twice the female"), exclusion (ḥajb), proportional reduction (‘aul), surplus return (radd), kalalah, and the al-‘Umariyyatān special case.

Validated by 15 automated tests against classic textbook scenarios. See §6.

3

Family Tree Builder • BUILT

Users add heirs by relationship; the engine automatically detects who is excluded (mahjūb) and, crucially, **explains why** — e.g. "a son screens the grandsons and brothers; the father screens all siblings."

4

Blockchain Wasiyyah Vault • BUILT (hash chain)

Every will and amendment becomes a block, cryptographically chained (SHA-256) to the one before. A built-in **live tamper-detection demo** proves that altering any past record is instantly flagged ("hash mismatch at block N"). This is a real hash chain standing in locally for Hyperledger Fabric.

5

Hibah & Waqf Planner • BUILT

Plan lifetime gifts (hibah) and endowments (waqf) alongside the wasiyyah, with the **1/3 bequest ceiling enforced in code** and surfaced to the user before they exceed it.

6

e-Signature & 2-Witness Module • SIMULATED PKI

A pre-sign checklist, two-witness capture, and a deterministic signature digest model the path to Mahkamah-Syariah-recognised validity via MyDigital ID. The *workflow* is real; the government PKI is simulated (no student access to the real API) — see §9.

7

Faraid Education Hub • BUILT

Bite-sized lessons and a verified Q&A on Faraid, hibah, and waqf — each answer carrying a citation — to raise a generation of financially-prepared, Shariah-literate Muslims.

Design principle running through all seven: *transparency over trust*. The app never says "just trust us" — it shows the verse, the ruling, the fraction, and the reason. That is what separates WarisanKita from a black-box calculator.

06 The Faraid Engine — Technical Deep Dive

The credibility of the entire platform rests on getting the inheritance mathematics exactly right. This is where we invested the most engineering rigour.

Why exact fractions matter

Islamic shares are rational numbers — $1/8$, $2/3$, $1/6$ — that frequently must be combined and reduced. Using floating-point arithmetic (e.g. $0.125 + 0.667$) introduces tiny errors that, on a million-ringgit estate, can mean a heir receiving the wrong amount. WarisanKita implements a custom **exact Fraction type** (GCD-reduced numerator/denominator), so every share stays a precise rational from input to ringgit output. **No rounding error — ever.**

Concepts the engine encodes

Concept (Arabic)	Meaning	Handled?
Furūd	Fixed Qur'anic shares for spouses, parents, grandparents, children, grandchildren, and all three sibling types.	✓
‘Aṣabah	Residuary heirs take what remains — "to the male a share equal to two females."	✓
Ḥajb / Mahjūb	Exclusion — e.g. a son screens grandsons & brothers; the father screens all siblings.	✓
‘Aul	Proportional reduction when fixed shares exceed the estate (denominator "inflates").	✓
Radd	Proportional return of surplus to fixed-share heirs when shares sum to less than 1.	✓
Kalālah	Estate of one with no ascendant/descendant — maternal vs full/paternal sibling rules.	✓
al-‘Umariyyatān	The special spouse-plus-both-parents case (al-Gharrāwayn).	✓

Madhhab note: shares follow the position common to the Sunni schools with a Shāfi‘ī default. The grandfather-with-siblings (*jadd wa ikhwah*) case treats the grandfather as the father and emits a note recommending scholar review.

Worked example — the demo estate

Inputs

- Gross estate: **RM 1,200,000**
- Bequest (wasiyyah): RM 400,000 → within 1/3 cap
- **Net distributable estate: RM 800,000**
- Heirs: **Wife, 2 Sons, 1 Daughter**

Step-by-step

1. Wife with children → fixed **1/8** = RM 100,000.
2. Residue = RM 700,000 to children as 'aṣabah.
3. Split 2:1:1 → 5 parts of RM 140,000.
4. Each son = 2 parts = **RM 280,000**;
daughter = 1 part = **RM 140,000**.

Result

Wife	1/8 · 12.5%	100,000
Son 1	35%	280,000
Son 2	35%	280,000
Daughter	17.5%	140,000

Verified against classic cases

The engine ships with an automated test suite (**15 tests, all passing**) covering the scenarios examiners use to catch faulty calculators:

Husband 1/4 with child

al-'Umariyyatān (H+F+M)

al-'Umariyyatān (W+F+M)

'Aul 6→7 (husband + 2 sisters)

Radd (mother + daughter)

Mahjūb exclusions

Granddaughter 1/6 "completion"

Estate conservation = 100%

'Aul worked live: for an estate with a husband and two full sisters, fixed shares (1/2 + 2/3) exceed the whole, so the engine scales the denominator from 6 to 7 — husband receives **3/7**, the sisters share **4/7**. This is the kind of edge case manual calculation routinely gets wrong.

07 System Architecture

A five-tier, mobile-first design that cleanly separates the client, gateway, domain services, data & ledger, and external government integrations.

TIER 1 — USERS

Muslim Citizen
Adult (18+) drafting

Family / Executor
Unlock & distribute

Religious Counselor
Verify edge cases

Mahkamah Syariah
Legal validity

Figure 7.1 — End-to-end architecture. Green-tagged components are implemented in the prototype today; grey/amber components are designed interfaces awaiting institutional partnerships.

Engineering choices that de-risk delivery

Repository-pattern data layer. Persistence sits behind an interface, so the JSON store used today can be swapped for PostgreSQL with no change to business logic.

Ledger abstraction. The hash chain implements the same append/verify contract a Hyperledger Fabric chaincode would expose — making the migration a substitution, not a rewrite.

Shared-origin proxy. The web client proxies `/api` to the Node backend, mirroring a production gateway and keeping the SPA and API on one origin.

LLM-ready drafter. The conversational flow is deterministic today but structured so a Llama-3 + RAG pipeline can drop in behind the same interface when budget allows.

08 End-to-End User Flow

An eight-step journey from sign-up to post-mortem distribution. Steps 2–7 form a lifetime update loop — every amendment becomes a new, immutable block.

Lifetime update loop. Marriage, divorce, a new child, or a property purchase re-triggers steps 2–7. Each amendment appends a new block, preserving the full audit history — so the will is always current and always provable.

Figure 8.1 — Complete user flow from eKYC sign-up to post-mortem distribution.

What this guarantees

Property	How the flow delivers it
Validity	eKYC + e-signature + two witnesses align the digital wasiyyah with Mahkamah Syariah requirements.
Accuracy	The Faraid engine, not the user, computes shares — removing the most common source of dispute.
Immutability	Every version is hash-chained; tampering with any past block is mathematically detectable.
Currency	The update loop keeps the will synchronised with real life-events instead of decaying into irrelevance.

09 Prototype Evidence — Real vs. Simulated

Honesty is a feature. The Islamic logic is real and verifiable; external government and infrastructure integrations are clearly marked as simulated, because they require credentials and partnerships a student project cannot obtain.

Component	Status	Notes
Faraid calculation engine	REAL	Exact rational arithmetic; 15 passing tests against textbook cases.
1/3 bequest rule & settlement order	REAL	Enforced in code with citations.
Wasiyyah drafting · family tree · hibah · waqf	REAL	Full create/read/update/delete, persisted to disk.
Blockchain vault	REAL HASH CHAIN	Tamper-evident SHA-256 chain replacing Hyperledger Fabric locally.
MyDigital ID / JPN eKYC	SIMULATED	No real government API access available to students.
e-Signature (PKI)	SIMULATED	Deterministic SHA-256 signature digest models the real flow.
Llama 3 + RAG assistant	SCRIPTED	Deterministic flow grounded in a local fiqh corpus — no model/network/key needed.
Database	JSON → SQL-READY	Behind a repository interface; swappable for PostgreSQL.

Test evidence

```
$ npm test
✓ engine > husband takes 1/4 when a child exists
✓ engine > al-'Umariyyatān: husband + father + mother
```

```
✓ engine > 'aul: husband + 2 full sisters → 3/7 & 4/7
✓ engine > radd: mother + daughter → 1/4 & 3/4
✓ engine > mahjūb: son screens brothers & grandsons
✓ engine > estate is fully conserved (sum = 100%)
... 9 more
```

Test Files 1 passed (1) · Tests 15 passed (15)

Live tamper-detection demo

Altering the payload of block 2 in the vault immediately yields “Tampered data at block 2: hash mismatch.” — proving the chain's integrity guarantee end-to-end.

Public, reproducible

The entire prototype — 45 files, ~8,300 lines — is public at github.com/TommiKirama/warisankita and runs with `npm run dev`. Nothing in this report is unverifiable.

Why disclose what is simulated? Because a proposal that hides its limitations cannot be trusted with a family's inheritance. Marking the boundary precisely is exactly what a real institutional partner — JAKIM, Amanah Raya — would demand before integration.

10 Market Analysis & Competitive Landscape

A large, underserved, and growing market with no incumbent unifying guidance, exact computation, and tamper-proof storage in a single consumer-grade product.

Who we serve

Primary

Muslim adults 18+: heads of household, business owners, and — often overlooked — single Muslims and mualaf with complex family scenarios.

Secondary

Family executors managing post-death distribution; religious counselors verifying edge cases.

Institutional

Mahkamah Syariah officers, Amanah Raya, Islamic banks & takaful operators seeking a customer-benefit offering.

Competitive landscape

Approach	Guidance	Exact Faraid	Tamper-proof	Cost & access
Traditional lawyer / wasiat writer	Human, high quality	Manual (error-prone)	Paper (loss/forgery risk)	High cost, intimidating

Approach	Guidance	Exact Faraid	Tamper-proof	Cost & access
Standalone Faraid calculators	None	Varies; black-box	No storage	Free but no will, no trust
Generic will-writing apps	Generic, not Shariah	X	Cloud (mutable)	Low — but not Islamic
WarisanKita	✓ Fiqh-grounded AI	✓ Exact, cited, tested	✓ Hash-chained vault	Freemium, phone-first

SWOT

Strengths

- Exact, tested Faraid engine — defensible technical moat
- Working prototype, not just slides
- Deep Maqāṣid alignment & public-good narrative

Weaknesses

- Legal validity depends on government integration
- Requires Shariah-authority endorsement to scale trust
- Student team & budget at prototype stage

Opportunities

- RM 70B+ frozen wealth = clear national mandate
- B2B bundling with Islamic banks & takaful
- Government digital-ID push (MyDigital ID)

Threats

- Regulatory/legal recognition timelines
- Public trust in digital wills & data privacy
- Incumbent wasiat-service providers reacting

11 Business Model & Financial Outlook

A sustainable public-good model: free for every Muslim at the basic tier, with premium and B2B revenue funding national-scale access.

Revenue streams

Stream	Who pays	Pricing	Rationale
Free basic tier	Every Muslim adult	RM 0	Maximises social impact; the core wasiyyah + Faraid is a right, not a product.

Stream	Who pays	Pricing	Rationale
Premium (complex estates)	Multi-property / business owners	RM 50–200 / year	Advanced asset handling, business succession, priority support.
B2B partnerships	Islamic banks & takaful operators	Licensing / per-seat	Offered as a customer benefit; drives distribution at scale.
Institutional node-hosting	JAKIM / Amanah Raya	Public-good grant	Governance partners host ledger nodes; underwrites credibility & sustainability.

Illustrative 3-year trajectory

Year	Registered users	Premium conversion	B2B partners	Indicative annual revenue
Year 1 (pilot → soft launch)	10,000	2%	1	RM 0.1–0.2M
Year 2 (state expansion)	80,000	3%	3	RM 0.8–1.2M
Year 3 (national)	300,000	4%	6	RM 3–4M

Figures are indicative planning assumptions for a student business case, not financial forecasts. The strategic value is unlocking frozen estates and protecting families — revenue sustains, rather than defines, the mission.

Sadaqah jariyah at national scale. Every wasiyyah drafted is a family protected from years of frozen wealth and inheritance fitnah. The business model exists to keep that protection free for those who need it most.

Key performance indicators

30k Wasiyyah completed (Yr 1 target)	< 3 s Faraid computation time	> 90% Drafting completion rate	RM ____ Estate value placed under valid wills
--	--	---	---

12 Implementation Roadmap

A five-phase delivery plan from Shariah-compliance research to a 100-user closed pilot in Selangor. The prototype already de-risks Phases 2–3.

Phase	Timeline	Focus	Key deliverables
1	Weeks 1–3	Research & Shariah compliance	JAKIM & Mahkamah Syariah Selangor consultations; Faraid ruleset validation by certified ulama; legal review with Amanah Raya; partner letters.
2	Weeks 4–7	Core backend & Faraid engine	Faraid engine (4-mazhab + 'aul/radd/kalalah) prototype done ; DB schema; API gateway; MyDigital ID eKYC; >95% unit coverage.
3	Weeks 8–10	AI layer & blockchain	Llama-3 on fatwa corpus; LangChain RAG; Hyperledger Fabric 3-node network; chaincode for wasiyyah lifecycle hash-chain done .
4	Weeks 11–12	Mobile app & UX	React Native iOS/Android; family-tree builder; chat UI; Faraid visualiser; offline-first; usability testing (20 adults).
5	Weeks 13–14	Pilot launch in Selangor	100-user closed pilot (Setapak & Shah Alam); 2 masjid awareness partners; iterate; soft launch with JAKIM endorsement.

Total: 14 weeks (~3.5 months) · **Team:** 5 (1 PM · 2 backend/AI · 1 mobile · 1 Shariah liaison)

What the prototype already proves

Phase 2 core is live. The exact-fraction Faraid engine and API gateway exist and pass tests today — the riskiest computation is already validated.

Phase 3 vault is live. A working tamper-evident ledger with a demonstrable attack-detection flow shows the blockchain concept end-to-end before Fabric is provisioned.

De-risked delivery. Because the two hardest technical pillars (exact Faraid + tamper-proof ledger) are already demonstrated, the remaining roadmap is largely integration, UX, and partnership work — the kind of work that scales predictably once endorsements are secured.

13 Maqāṣid al-Sharī‘ah Alignment

WarisanKita is classified at the **Ḍarūriyāt (necessities)** level — it fulfils a fundamental Islamic obligation, simultaneously serving all five higher objectives of the Sharī‘ah.

Maqṣid	How WarisanKita serves it
Ḥifẓ al-Māl Protection of Wealth — primary	Unfreezes inherited wealth by ensuring valid wills and exact, dispute-free distribution.

Maqṣid	How WarisanKita serves it
Ḥifẓ al-Dīn Protection of Religion	Executes the Qur'anic command of just inheritance (An-Nisā' 11–12, 176) faithfully.
Ḥifẓ al-Nafs Protection of Life	Prevents the destitution of widows and dependants who lose access to family assets.
Ḥifẓ al-Nasl Protection of Lineage	Preserves family harmony by removing the inheritance disputes that fracture families.
Ḥifẓ al-'Aql Protection of Intellect	Educates the Ummah on Islamic estate planning through the Faraid Education Hub.

Category of Ummah need served

✓ **Promoting Unity of Ummah** — prevents inheritance disputes that fracture families.

✓ **Preserving the Essence of Religion** — implements Qur'anic inheritance law correctly.

✓ **Fighting Corruption** — the ledger prevents will tampering and forgery.

✓ **Eradicating Poverty** — unlocks frozen estates for rightful heirs.

✓ **Spreading Knowledge** — the Education Hub builds Islamic financial literacy.

Necessity level: **DHARŪRIYĀT** — an essential need, not a luxury.

Failure to execute the Qur'anic inheritance commands is a violation of one of the five Ḍarūriyāt (Ḥifẓ al-Māl). With RM 70+ billion of Muslim assets frozen and real hardship falling on widows and orphans, addressing this is an essential need — making WarisanKita a work of sadaqah jariyah at national scale.

14 Risk Assessment & Mitigation

A serious estate-planning platform must confront legal, Shariah, technical, and trust risks directly. Here is how each is managed.

Risk	Likelihood	Impact	Mitigation
Faraid miscalculation	Low	Severe	Exact-fraction engine + 15-test suite; mandatory ulama validation of the ruleset; on-screen citations; advisory to confirm with a certified faraidh practitioner.
Legal recognition delays	Medium	High	Early engagement with Mahkamah Syariah & Amanah Raya; design the e-sign + 2-witness + eKYC flow to existing legal requirements.
Shariah authority endorsement	Medium	High	JAKIM consultation in Phase 1; transparent, cited rulings; madhhab notes and scholar-review flags on edge cases.
Data privacy & security	Medium	High	Encrypted PII, ledger stores proofs (hashes) not raw documents, principle-of-least-data; PDPA-aligned design.
Public trust in digital wills	Medium	Medium	Institutional node-hosting (JAKIM/Amanah Raya), masjid-led awareness, and visible "real vs simulated" transparency.
AI hallucination (future LLM)	Low	High	RAG grounded strictly in JAKIM e-fatwa + verified fiqh corpus; deterministic scripted fallback (today's default).
Integration dependency	Medium	Medium	Repository/ledger abstractions make government & bank integrations swappable; graceful degradation to manual flows.

Ethical guardrail

WarisanKita is explicit, in-product and in this document, that it is a planning and computation aid. A real distribution should always be confirmed with a certified *faraidh* practitioner or JAKIM. The app's job is to make that final step easy and rare-to-be-needed — not to replace scholarly authority.

15 Team, Budget & Conclusion

Team structure

Role	Responsibility
Project Manager	Coordination, partnerships, roadmap & assessment delivery.
Backend / AI Engineer ×2	Faraid engine, API, ledger, scripted drafter, future RAG pipeline.
Mobile / UX Engineer	React Native build, family-tree & chat UI, Faraid visualiser, usability testing.
Shariah Liaison	Ulama validation, JAKIM e-fatwa corpus, madhhab notes, ruling citations.

Indicative budget (prototype & pilot)

Item	Estimate (RM)
Cloud hosting & infrastructure	2,000
MyDigital ID / API access	1,500
AI compute (fine-tuning & RAG)	2,000
JAKIM / ulama consultation	1,500
Pilot honorariums & masjid awareness	1,500
Total	≈ 8,500

Conclusion

WarisanKita takes a national crisis — RM 70+ billion of frozen Muslim wealth — and turns its solution into a five-minute task on a phone: accurate to the Qur'an, impossible to tamper with, and easy to understand.

It is not a slideware concept. The hardest parts already work and are public: an exact-fraction Faraid engine validated by automated tests, and a tamper-evident vault with a live attack-detection demo. What remains — government integration, the mobile build, institutional endorsement — is well-understood delivery work, materially de-risked by the prototype. Above all, the platform serves *Hifẓ al-Māl* and the four other Maqāṣid simultaneously: it is technology in the service of Qur'anic justice.

🔥 *"Whoever leaves wealth, it is for his heirs."* — Ṣaḥīḥ al-Bukhārī 2298.

WarisanKita exists to make sure it actually reaches them.

Explore the working prototype

github.com/TommiKirama/warisankita — React + TypeScript client · Node/Express API · exact Faraid engine · hash-chained vault · 15 passing tests.

Disclaimer. Prototype for educational purposes; not a substitute for professional legal or Shariah advice. All distributions should be verified with a certified faraidh practitioner / JAKIM. Government and infrastructure integrations are simulated in the current build, as documented in §9.
